1. Things That Went Well

The frontend pages were built relatively quickly and seamlessly. The existing data model was easily migrated into a database and works well with the APIs.

2. Things That Could Have Gone Better

The team could have had better communication on the requirements to make it clearer. Testing was not prioritized in this sprint, and it should be more prevalent in the next sprint.

3. Things That Surprised Us

We had to update the data model to create more tables to incorporate some of the functionalities that which wasn't expected.

4. Lessons Learned

We learned how to better manage the product backlog and how that helps manage the tasks between the team.

5. Final Thoughts

We can keep the data model and most of the APIs written for in the backend.

The frontend will have to be refactored more to full incorporate the backed APIs and retrieve data from the database.
